GLP COMPLIANCE STATEMENT

Since method development is excluded from Good Laboratory Practice (GLP) regulations as defined by the US EPA in 40 CFR 160.3, the development of the method described in the present report was not conducted under GLP; however, the method was developed in a GLP environment. Residue data included in this report were collected in compliance with GLP.

1. Summary

This report describes the tolerance enforcement method for analyzing residues of parent RH-117,281 in tomato RAC (raw agricultural commodity) and the processed fractions, tomato puree and tomato paste. This report is the compilation of two previously issued preliminary residue methods (Ref 1 and 2) with additional data from field residue trials (Ref 3).

RH-117,281 residues in tomato RAC are extracted with acetonitrile. The extracts are cleaned-up using liquid-liquid partitioning followed by carbon solid phase extraction (SPE) and alumina-B SPE. RH-117,281 residues are extracted from tomato puree and paste by acetonitrile coupled with Matrix Solid Phase Dispersion (MSPD). The extracts are cleaned-up using carbon SPE and alumina-B SPE. In all cases, quantitation of RH-117,281 is performed by capillary gas-liquid chromatography using electron capture detection (GC/ECD). Residues were confirmed using capillary gas-liquid chromatography with mass selective detection (GC/MSD). The limit of quantitation (LOQ) is 0.010 ppm, established by actual fortifications at this level. The limit of detection (LOD) is estimated to be 0.003 ppm. The mean recoveries of RH-117,281 from tomato RAC, puree and paste using GC/ECD quantitation are summarized in the following table.

	Tomato RAC	Tomato Puree	Tomato Paste
Mean Recovery (%)	93.87	90.69	94.12
Standard Deviation (%)	10.95	13.65	9.33
Relative Std Dev (%)	10.71	15.05	9.91
Number of Samples	25	26	26

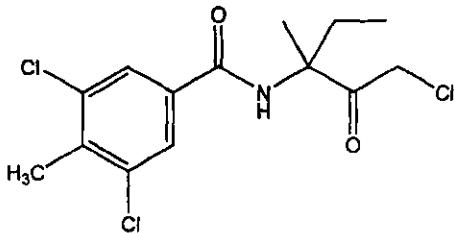

2. Introduction

RH-117,281 is a fungicide recently developed at Rohm and Haas Company and targeted for use on a variety of crops. In order to file for the commercial registration, an analytical residue method is required to establish and enforce tolerances of RH-117,281 in tomato and processed fractions.

3. Experimental Compound

The structure of RH-117,281 is shown below:

TR 34-99-111

CA Name	3,5-dichloro-N-(3-chloro-1-ethyl-4-methyl-2-oxopropyl)-4-methylbenzamide			
Proposed Generic Name	zoxamide			
CAS Number	156052-68-5			
R&HLD *	Lot #	Purity	Appearance	Expiration Date
RH-117,281	ELM1157	97.9%	White Solid	Nov 11, 2001

*The full R&H number is RH-117,821. The designation typically used in studies is the four digit abbreviation RH-7281.

4. Chemicals and Supplies

Chemicals	Grade	Supplier	Catalogue Number
Acetonitrile	HPLC	JT Baker	9017-33
Alumina B cartridges	LC-Alumina B (6 ml)	Supelco	5-7085
Aluminum Oxide	Brockman I Basic Powder	Baker	0539-01
C ₁₈ Silica (Bordexil)	Envirelut	Varian	1221-4016
Carbon cartridges	Envi-Carb (6 ml)	Supelco	5-7094
Ethyl Acetate	HPLC	JT Baker	9282-03
Hexane	Ultra-Resi-Analyzed or Optima	JT Baker	9262-02
Sodium Bicarbonate (NaHCO ₃)	A.C.S. Reagent	Fisher Scientific	H303-1
Sodium Sulfate (Na ₂ SO ₄)	A.C.S. Reagent anhydrous	JT Baker	3506-01
Water ^a	Milli-Q®	Aldrich or EM Science Millipore	23,931-3 SX0760-1

TR 34-99-111

- * Other manufacturer brands may be substituted if shown to be suitable
b Prepared in-house using Milli-Q® Water Purification System

Preparation of Solutions

1) 0.1 M sodium bicarbonate solution: dissolve 8.3 g NaHCO₃ in a final volume of 1000 mL Milli-Q® water using a 1000 mL volumetric flask

2) Ethyl Acetate/Hexane solutions

Ethyl Acetate (mL)	Hexane (mL)	Final Proportion of Ethyl Acetate/Hexane
100	900	10/90
300	700	30/70

Note all solutions were prepared using graduated cylinders to separately measure volumes and were stored in 1000 mL bottles.

5. Equipment

In addition to standard laboratory equipment (balance, pipets, spatulas, etc.) the following specific items were used

Equipment	Description	Source ^b
Blender	Model 31BL92	Waring
Blender jar	Model 8470 (500 mL, glass)	Eberbach
Bottle, glass	1000 mL (Media Storage)	Wheaton
Bottle, centrifuge	250 mL	VWR
Centrifuge	Model AccuSpin FR	Beckman
Centrifuge rotor	AH-4	Beckman
Cylinder, graduated	25, 50, 100, 250, 500, 1000mL	VWR
Filter Paper	#4 (7 cm diameter)	Whatman
Flask, Erlenmeyer	1000 mL (24/40 ST)	Kimax
Flask, Filter	250 mL	Kimax
Flask, Pear-shaped Recovery	100, 200, 500 mL (24/40 ST)	Ace Glass
Flask, Round Bottom	100, 500 mL (24/40 ST)	Kimax
Flask, Volumetric	100, 500, 1000 mL	Kimax
Knife Chopper	Model 8181	Hobart
Jar, Polyethylene	Cat. # 57184	Supelco
Funnel, Buchner	200 mL	Coors
Funnel, Separatory	500 mL	Kimax
Jar, glass	2 ounce	EmSCO

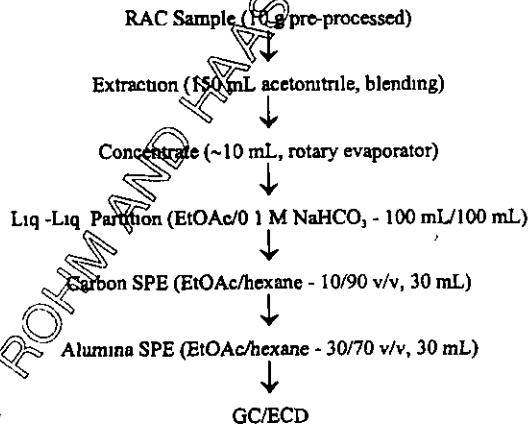

Mortar and pestle	4 ounce	Fisher
Oven, vacuum	Model 1400E	VWR
Pipet, volumetric	10 mL	Kimax
Pipetman®	Model P-200, P-1000	Rainin
Reservoirs, SPE	60 mL, Cat. # 57022	Supelco
Rotary Evaporator (Rotovap)	Models EL 131 or B-168	Buchi
Sonicator	Models 2210 or 210	Branson
SPE Manifold	Visiprep™	Supelco
Tissuemizer	Model TR-10	Tekmar

*Other manufacturer brands may be substituted if shown to be suitable

6. Methods

6.1 Method for Tomato RAC

6.1.1 Method Flow Diagram

6.1.2 Sample Preparation

Prepare tomatoes by chopping the fruit with dry ice using a food chopper. Allow the dry ice to sublime overnight in a freezer and store the processed samples in a freezer.

6.1.3 Sample Extraction

The tomato samples can be extracted by blending or homogenization

Blending Weigh 10 g of processed tomato sample and place it in a glass blender jar. If the sample is to be fortified, place the blender jar in a ventilated hood and add a known amount of RH-7281 standard (in hexane) to the tomato sample. Keep the sample in the hood for 1 hour to allow the hexane to evaporate. Add 100 mL of acetonitrile to the blender jar and blend the sample for ~60 sec at the low speed setting. Using a Buchner funnel, filter the homogenate through Whatman #4 filter paper into a 250 mL filter flask. Rinse the homogenizing vessel with an additional 50 mL acetonitrile. Transfer the filtrate to a 500 mL round-bottom flask and concentrate to ~10 mL using a rotary evaporator ($\leq 30^\circ$ C, 50-100 mm Hg).

Homogenization Weigh 10 g of processed tomato sample and place it in a 250 mL centrifuge bottle. If the sample is to be fortified, place the bottle in a ventilated hood and add a known amount of RH-7281 standard (in hexane) to the tomato sample. Keep the sample in the hood for 1 hour to allow the hexane to evaporate. Add 50 mL acetonitrile to the bottle and homogenize for ~60 sec using a Tissutemizer®. Centrifuge the sample at 4,000 rpm for 10 min at $\sim 10^\circ$ C. Using a Buchner funnel, filter the supernatant through Whatman #4 filter paper into a 250 mL filter flask. Repeat the homogenization and filtration procedures twice with 50 mL acetonitrile each time. Transfer the filtrate to a 500 mL round-bottom flask and concentrate to ~10 mL using a rotary evaporator ($\leq 30^\circ$ C, 50-100 mm Hg).

6.1.4 Liquid-Liquid Partitioning

Add 100 mL of 0.1 M sodium bicarbonate solution to the sample in the round-bottom flask and then transfer the sample to a 500 mL separatory funnel. Rinse the flask with 100 mL ethyl acetate and add to the separatory funnel. Shake the separatory funnel for ~1 min with frequent venting. After the phases have separated, drain the lower, aqueous phase into the original round-bottom flask and decant the upper, organic phase into a new 500 mL pear-shaped/recovery flask. Re-extract the aqueous phase with 100 mL ethyl acetate as above. Drain and discard the aqueous phase. Combine the organic phases and take to dryness using a rotary evaporator ($\leq 50^\circ$ C, 50-100 mm Hg). Redissolve the residue in 10 mL hexane using sonication for 10-20 sec.

6.1.5 Carbon Solid Phase Extraction (SPE)

To each carbon SPE cartridge, add a small amount of anhydrous sodium sulfate (~0.5 cm) and pre-rinse the cartridge with 5 mL ethyl acetate followed by two rinses of 5 mL hexane. Do not let the cartridge run dry. Discard the rinsates. Apply the 10 mL residue in hexane (section 6.1.4) and collect the effluent. Rinse the recovery flask twice with 15 mL 10/90 (v/v) ethyl acetate/hexane each time and apply the rinsates to the cartridge. Collect the effluents in a 200 mL pear-shaped recovery flask (see Note on page 14). Take

the sample to dryness using a rotary evaporator ($\leq 50^\circ \text{C}$, 50-100 mm Hg). Dissolve the residue in 10 mL hexane using sonication for 10-20 sec.

6.1.6 Alumina B Solid Phase Extraction

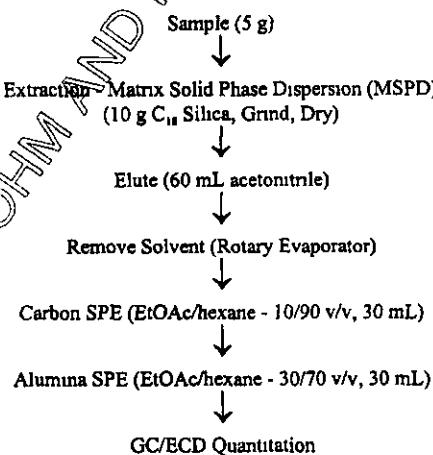

Pre-rinse each alumina B SPE cartridge with 5 mL ethyl acetate followed by two 5 mL rinses with hexane. Do not let the cartridge run dry. Discard the rinsates. Apply the 10 mL residue in hexane from section 6.1.5 and discard the effluent. Rinse the recovery flask with 10 mL hexane and apply to the cartridge, again discarding the effluent. Finally, elute RH-7281 from the cartridge using 30 mL of 30/70 (v/v) ethyl acetate/hexane and collect the eluate in a 100 mL pear-shaped recovery flask (see Note page 14). Take the sample to dryness using a rotary evaporator ($\leq 50^\circ \text{C}$, 50-100 mm Hg). Redissolve the residue in 10 mL hexane using sonication for 10-20 sec. The sample is now ready for quantitation (see section 7).

6.1.7 Time to Run a Sample Set

The time required to run one sample set of 6 samples through the entire method is approximately 17 hours including GC analysis.

6.2 Method for tomato puree and tomato juice

6.2.1 Method Flow Diagram

6.2.2 Sample Preparation

Tomato puree and tomato paste are used directly without processing

6.2.3 Extraction Matrix Solid Phase Dispersion

Weigh 5 g of tomato puree or tomato paste into a mortar. If the sample is to be fortified, place the mortar in a ventilated hood and add a known amount of RFB7281 standard (in hexane) to the tomato sample. Keep the sample in the hood for 1 hour to allow the hexane to evaporate. Add 10 g of C₁₈ silica and grind with pestle for approximately one minute or so until the sample is homogeneous. Dry the sample in a vacuum oven under full vacuum for 40 minutes at ~50°C. Break-up the clumped dried matrix using a pestle and spatula.

Pack a 60 mL SPE reservoir as follows:

- 1 Place a polyethylene frit in the bottom
- 2 Add 5 g of aluminum oxide
3. Place a frit on top of the aluminum oxide
- 4 Add the C₁₈ silica/puree or paste matrix contained in the mortar
- 5 Place a frit on top of C₁₈ silica/puree or paste matrix and then pack tube
- 6 Place the tube on a Visiprep™ unit

Add 60 mL acetonitrile to the mortar as a rinse then add this rinse to the packed SPE tube. Elute the sample and collect the acetonitrile eluate in a 2 ounce (~60 mL) glass jar. Transfer the eluate to a 100 mL round bottom flask and rinse the jar with an additional 5 mL of acetonitrile. Take the sample to dryness using a rotary evaporator (~50°C, 50-100 mm Hg). Redissolve the residue in 10 mL hexane using sonication (10-20 sec).

6.2.4 Carbon Solid Phase Extraction

To each carbon SPE cartridge, add a small amount of anhydrous sodium sulfate (~0.5 cm) and pre-rinse the cartridge with 5 mL ethyl acetate followed by two rinses of 5 mL hexane. Do not let the cartridge run dry. Discard the rinsates. Apply the 10 mL residue in hexane (section 6.2.3) to the carbon cartridges and collect the effluent. Rinse the round bottom flask with 2 x 15 mL of 10/90 (v/v) of ethyl acetate/hexane and pass each rinsate through the carbon cartridge. Collect the effluents in a 100 mL round bottom flask and take the sample to dryness using a rotary evaporator (~50°C, 50-100 mm Hg). Redissolve the residue in 10 mL hexane using sonication (10-20 sec).

6.2.5 Alumina-B Solid Phase Extraction

Pre-rinse each alumina B SPE cartridge with 5 mL ethyl acetate followed by two 5 mL rinses with hexane. Do not let the cartridge run dry. Discard the rinsates. Apply the 10 mL residue in hexane from section 6.2.4 and discard the effluent. Rinse the round bottom flask with 10 mL hexane and apply to the cartridge, again discarding the effluent. Add 30 mL of 30/70 (v/v) of ethyl acetate/hexane to the empty round bottom and sonicate for ~10 sec. Add this to the alumina B cartridge and collect the eluate containing RH-7281 in a 100 mL round bottom flask (see Note below). Take the sample to dryness using a rotary evaporator (~50°C, 50–100 mm Hg). Redissolve the residue in 5 mL hexane using sonication for 10–20 sec. The sample is now ready for quantitation (see section 7).

6.2.6 Time to Run a Sample Set

The time required to run one sample set of 6 samples through the entire method is approximately 15 hours including GC analysis.

Note Elution Profile Check

The elution profile should be checked for each new lot of Alumina-B, or Carbon to minimize the effect of lot to lot variability. A general procedure is described as follows:

- 1) Add 10 mL of 0.10 µg/mL RH-7281 standard in hexane to the column or cartridge
- 2) Follow the elution schemes as outlined for each individual procedure (see sections 6.1.5, 6.1.6, 6.2.4, or 6.2.5) and collect the pre-elution (Alumina B) and target elution cuts
- 3) Wash the column with 30 mL of ethyl acetate and collect the post-elution cut
- 4) Take each of the cuts to dryness and redissolve in 10 mL of ethyl acetate. Inject them as outlined for GC/ECD quantitation (section 7)
- 5) If the target cut contains a minimum of 85% of RH-7281, the lot can be considered acceptable
- 6) If the post-wash cut contains a more than 15% of RH-7281, the target elution volume or the percentage of ethyl acetate in the eluting solvent should be modified. If the pre-elution cut of Alumina B contains more than 15% of RH-7281, the lot should be considered unacceptable.

7. Quantitation

The primary quantitation method is capillary gas chromatography with electron capture detection (GC/ECD) and the confirmatory method is capillary gas chromatography with mass selective detection (GC/MSD).

7.1 Instrumentation and conditions

See comments on GC maintenance in Section 9

7.1.1 Primary Quantitation

	Tomato RAC	Puree and Paste
Quantitation Method	GC/ECD	GC/ECD
Instrument	HP* 6890 μECD	HP 6890 μECD
Injection: mode	on-column	on-column
temp. (°C)	150	150
volume (μL)	1.0	1.0
Column: analytical	HP-5MS 0.25 mm ID x 30 m 0.25 μm film	HP-5MS 0.25 mm ID x 30 m 0.25 μm film
Carrier gas	helium	helium
Head pressure (psi)	13.5	13.5
Flow rate (mL/min.)	1.0	1.0
Detector temp. (°C)	300	300
Oven Temp. Program:		
Initial temp. (°C)	80 (hold 1 min.)	80 (hold 1 min.)
Ramp 1 (°C/min.)	20	20
Temp. 1 (°C)	260 (hold 8 min.)	250 (hold 5 min.)
Ramp 2 (°C/min.)	30	30
Temp. 2 (°C)	290 (hold 1 min.)	280 (hold for 3 min.)
Retention time(min.)*		
RH-7281	-11-12	-11-12

* HP: Hewlett Packard

** Retention time might vary depending on column maintenance (see comments in Section 9) or the oven temperature program (for example, if ramp oven to 260°C at 35°C/min. and hold 7 min. at 260°C, then retention time of RH-7281 will be ~8-9 min.)

7.1.2 Confirmatory Quantitation

	Tomato RAC	Puree and Paste
Quantitation Method	GC/MSD	GC/MSD
Instrument	HP 6890 HP 5973 MSD	HP 6890 HP 5973 MSD

Temp. 1 (°C)	250 (hold 3 min)	250 (hold 8 min)
Ramp 2 (°C/min.)	30	30
Temp. 2 (°C)	280 (hold 3 min)	280 (hold for 1 min)
Monitored ions (m/z)	187, 189, 258*	187, 189, 258*
Retention time(min.)**		
RH-7281	~11-12	~11-12

* Quantitation ion 258m/z

** Retention time might vary depending on column maintenance (see comments in Section 9)

Note Brands of analytical instruments from other manufacturers might be suitable, however, no attempt was made to evaluate such instruments

7.2 Preparation of Standard Calibration Curves

Prepare a 100 µg/mL standard stock solution by weighing 10 mg of RH-7281 (correct for purity of standard) into a 100 mL volumetric flask. Bring up to volume with ethyl acetate.

TR 34-99-111

Prepare a 1.0 µg/mL stock solution by pipetting 1.0 mL of 100 µg/mL stock solution into a 100 mL volumetric flask and bringing to volume with hexane.

Prepare a 0.10 µg/mL stock solution by pipetting 10 mL of 1.0 µg/mL into a 100 mL volumetric flask and bringing to volume with hexane

Prepare standard solutions of 0.005, 0.010, 0.020, 0.050, and 0.10 µg/mL by pipetting the appropriate volumes of 0.10 µg/mL and 1.0 µg/mL stock solutions shown in the following table into a 100 mL volumetric flask and bringing to volume with hexane

Stock Solution (µg/mL)	Volume (mL) of Stock Solution	Final Concentration (µg/mL)
0.10	5.0	0.005
0.10	10	0.010
0.10	20	0.020
1.0	5.0	0.050
1.0	10	0.10

The standards should be stored in a refrigerator and remade every six months as a precautionary measure to ensure reliability (Lab Memo 34-99-12)

A minimum of four standard solutions are prepared in a desired concentration range and injected in duplicate for GC/ECD or GC/MSD quantitation. Standards are quantitated by peak height or peak area, ensuring that the integration method is consistent for all standards and samples analyzed during a GC run. To obtain a standard calibration curve, the instrument responses (e.g. peak heights) for the standards are fit to the concentrations of standard using linear or quadratic regression. The concentration of RH-7281 in the sample is then determined from the regression equation for the standard calibration curve.

7.3 Fortification/Recovery

Percent recovery is calculated by measuring the peak height (or peak area, see section 7.2), calculating the µg/mL (ppm) found from the regression equation for the standard calibration curve, and correcting for background in the control sample as shown in Equation 1:

$$\frac{[\text{Found } (\mu\text{g/mL}) \times \text{Final Vol. (mL)}] - [\text{Control } (\mu\text{g})] \times 100\%}{\text{Fortification Amount } (\mu\text{g})} = \% \text{ Recovery} \quad (\text{Eq. 1})$$

7.4 Sample Analysis

If necessary, the samples are diluted to an appropriate volume to give a final concentration within the standard curve range, preferably in the range of 0.010-0.050 ppm. The residue concentration is determined as follows:

$$\frac{\text{Residue Found } (\mu\text{g/mL}) \times \text{Final Vol. (mL)}}{\text{Sample Weight (g)}} = \mu\text{g/g} = \text{ppm} \quad (\text{Eq. 2})$$

7.5 Sample Calculations

A typical calculation for the recovery of a 0.050 ppm ($\mu\text{g/g}$) fortification of tomato (Table 1 and Figure 11) is demonstrated as follows: the peak height of RH-7281 is 33,546,477 which, from the standard calibration curve, corresponds to 0.04918 ppm ($\mu\text{g/mL}$). The recovery for a 10.0 g sample fortified with 0.500 μg RH-7281, a final sample volume of 10.0 mL, and no residue in the control is calculated as below:

$$\frac{[0.04918 \mu\text{g/mL} \times 10.0 \text{ mL}] - [0 \mu\text{g}]}{0.500 \mu\text{g}} \times 100\% = 98.4\%$$

A typical calculation for determining RH-7281 residue in field-aged tomatoes (Figure 13) is demonstrated as follows: the peak area of RH-7281 is 343,492, which, from the standard calibration curve, corresponds to 0.03126 ppm ($\mu\text{g/mL}$). For a 10 g field-aged sample in a final sample volume of 28.0 mL, the amount of RH-7281 residue is calculated using Eq. 2.

$$\frac{0.03126 \mu\text{g/mL} \times 28.0 \text{ mL}}{10.0 \text{ g}} = 0.0875 \mu\text{g/g} = 0.0875 \text{ ppm}$$

8. Radiovalidation

Samples from a ^{14}C -RH-7281 tomato metabolism study (Ref. 4) were analyzed using the residue analytical method for parent RH-7281 in tomato (Ref. 1). The results (see Appendix I) are summarized in the following table.

<u>RH-7281 Residue</u>	<u>Analytical Method</u>	<u>Metabolism Study</u>
ppm	0.092 ± 0.001	0.116 ± 0.062

Radiovalidation of the analytical method demonstrated that the residues of RH-7281 present in a tomato metabolism sample were adequately measured by the analytical method.

9. Results and Discussion

Both primary (GC/ECD) and confirmatory (GC/MSD) quantitation procedures have acceptable sensitivity for RH-7281. Representative chromatograms of the primary quantitation method are shown in Figures 1-29 and those for the confirmatory method are shown in Figures 30-41. Fortification recoveries for tomato RAC, puree, and paste are shown in Tables 1, 2, and 3, respectively. The limit of quantitation (LOQ), limit of detection (LOD), and the overall method recoveries of RH-7281 using the primary quantitation method (GC/ECD) are summarized for each matrix in the following table

	Tomato RAC	Tomato Puree	Tomato Paste
LOQ (ppm)	0.010	0.010	0.010
LOD (ppm)	0.003	0.003	0.003
Mean Recovery (%)	93.83	90.69	94.12
Standard Deviation (%)	10.05	13.65	9.33
Relative Std. Dev. (%)	10.71	15.05	9.91
Number of Samples	25	26	26
Maximum Recovery (%)	113	113	117
Minimum Recovery (%)	78.0	69.9	76.8

There was no interference found in control tomato samples at the same retention time as RH-7281 using GC/ECD (Figures 7-9, 16-18, 23-25) or GC/MSD (Figures 35, 38, 40).

Proper maintenance of the GC/ECD and GC/MSD injection and inlet systems is critically important to the chromatography of RH-7281. For example, increasing the injection temperature to 290°C (30°C/min.) after the elution of the RH-7281 peak removed residues that remained in the inlet system. Also, removal of 5 - 10 cm of the analytical column after a few analytical sets (about 100 samples) can improve chromatography. It should be noted, however, that changing the length of the analytical column can slightly alter the retention time of RH-7281. The injection port should also be cleaned regularly (after about 100 injections) by disassembling the port and sonicating it in methanol for several minutes. Finally, if chromatography does not improve, install a new analytical column.

APPENDIX I**Radiovalidation**

The radiovalidation experiment validated the ability of the analytical method to measure RH-7281 in field aged residues by comparing the amount of RH-7281 detected by the analytical method to the amount of RH-7281 measured in a tomato metabolism study.

Briefly, the control and treated samples were extracted and cleaned up using the residue analytical method. Simultaneously, two levels (0.050 and 0.10 ppm) of RH-7281 fortification of the control sample were processed by the analytical method as a measure of method recovery. The levels of radioactivity were measured in subsamples of the initial extracts and filter cakes (bound radioactivity) in order to determine the material balance and extraction efficiency of the method. The concentration of RH-7281 in the final extracts was quantitated by GC/ECD (primary quantitation method). The results are presented in Tables 1 and 2 below.

The residue analytical method extracted 96.6% of the radioactivity in the tomato sample (Table 1) and the average recovery of the 2 fortifications was 93.0% (Table 2). These data demonstrate that the residues of RH-7281 were accurately measured by the analytical method.

The level of RH-7281 found in the metabolism study (Table 2) was 0.139 ppm (normalized) or 0.116 ppm (uncorrected). Since there was significant variability (53.2 % relative standard deviation) in the total radioactive residues (TRR) of the tomato sample (Table 1), the subsample analyzed in the metabolism study could have a residue of 0.139 \pm 0.073 (i.e. \pm 53.2 %) or 0.116 \pm 0.062. The average residue level of RH-7281 found by the analytical method was 0.099 \pm 0.001 ppm which is within the variability of the metabolism value. Based on these results, the residue analytical method was successfully radiovalidated.

TR 34-99-111

**Table 1 Efficiency of Extraction and Material Balance of Radioactivity
from Tomato RAC**

<u>Combustion Results.^a</u>	
Total Radioactive Residues (TRR)	$0.263 \pm 0.140 \mu\text{g/g}$
Relative Standard Deviation	53.2 %
<u>Extraction Results.^b</u>	
Extracted	$11,200 \pm 283 \text{ dpm/g}$
Bound	$403 \pm 117 \text{ dpm/g}$
Total Recovered Radioactivity	$11,600 \pm 400 \text{ dpm/g}$
Extracted TRR	$0.259 \pm 0.009 \mu\text{g/g}$
Extraction Efficiency ^c	96.6 %
Material Balance ^d	98.5 %

^a Data from Ref. 4 (Table 2)

TRR (Total Radioactive Residues)

number of samples ≈ 15

specific radioactivity = 44,800 dpm/ μg ^b number of samples = 2^c Extraction Efficiency = [Extracted/Total Recovered Radioactivity] × 100^d Material Balance = [Extracted TRR/Combustion TRR] × 100

TR 34-99-111

Table 2 Quantitation of RH-7281 in Tomato Metabolism Samples
Using the Tomato Residue Analytical Method (TR34-99-68)

RH-7281	Analytical Method (GC/ECD)	Metabolism Study (LC)
Fortification Recovery (%)		
0 050 ppm	91.5	
0 10 ppm	94.4	
Mean (%)	93.0	
Residue found		
	0.093	
	0.093	
Mean (ppm)	0.092 ± 0.001	0.116 ^b
Residue corrected	ppm	0.099 ± 0.001 ^a
		0.139 ± 0.073 ^c

^a corrected for average fortification recovery of 93.0 %

ppm corrected = (ppm found)/0.93 = 0.092 ppm/0.93

^b value calculated from data in Ref 4 (Table 4) as follows

LC Results:

RH-7281 peak = 4240 dpm

injected on LC = 7730 dpm

% of dpm in RH-7281 = 54.85%

RH-7281 residues in EtOAc fraction:

EtOAc = 73% of TRR = 73% × 0.29 µg/g = 0.212 µg/g (ppm)

RH-7281 = 54.85% of EtOAc = 54.85% of 0.212 ppm = 0.116 ppm

^c value reported in Ref 4 (Table 4) ± 53.2 % (± RSD from combustion results)
